Water Tips For Residents

Know where your master water shut off valve is located!

Locate your master water shut off valve in your home. Show any children or residents who will be home alone where it is located and how to shut it off. If a water pipe were to break, it could cause flooding and water loss.

Check for leaks in pipes and faucets!

Even a tiny leak in pipes, faucets or running toilets can result in increased consumption and wasted water over a short period of time. Fix leaks immediately.

Check the toilet for leaks!

Leaking or running toilets can cause excessive water consumption, which will cost you money and waste water unnecessarily.

Vacations!

Going away on a vacation whether short or long, remember to shut main valve off –usually located just before the water meter or where water line enters the home.

Put your hot water heater on the vacation setting, if it has one, or reduce the temperature when you go away for holidays to save the cost of heating water while you are away.

Check flow indicator!

Make it a habit to periodically check the flow indicator on the water meter. If you have everything off, the indicator should not move at all. If it is moving, water is traveling through the meter and something is using water.

Water conservation is on the forefront of the Municipality of West Elgin and it is with the homeowner's help that we strive to achieve more efficient water consumption. If you have concerns about this please contact the Municipality.
Please see the reverse side for other important information.
